# Setup Apache Web Server Legacy Material

Material is kept here for reference from the main article, Setup Apache Web Server on Ubuntu LInux.

## Provide Server Name

As of June 5, 2012 the more recent build of Ubuntu 12 and Apache 2.2.22 add an entry into the file called **name**,

```
sudo echo "ServerName $(bash -c "hostname")" >> /etc/apache2/conf.d/name"
```

With even older versions of Apache and Ubuntu (I need to track down when this changed) I traditionally added the entry to **httpd.conf**,

```
sudo echo "ServerName $(bash -c "hostname")" >> /etc/apache2/httpd.conf"
```
